DETAILED ACTION

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 11 and the claims depending on claim 11 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 11 recites in the first line a method claim yet depends on claim 9 drawn to structure. In addition in claim 11 and 26, the use of the term "can be" performing a function is not a positive limitation in any patentable sense. For examination purposes, claim 11 will be treated as a claim dependent on claim 9 and drawn to structure.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1-3, 6-18, 21 and 22-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Grego (4,762,414) in view of de Groot (5,600,441) and Cocito et al. (5,160,973).

Grego shows an interferometer comprising:

a laser source (3) which produces an output having two superimposed orthogonally polarized beams having S and P polarization, with a frequency difference between them;

means for splitting the polarized beams (5) into measurement and reference beams without altering the characteristics of the polarized beams;

means for causing the reference beams to interfere (43);

a reference photodetector (6) for detecting the reference beams and providing a reference signal;

means (8) for providing the measurement beam to strike an object at an oblique angle having a polarization coating (8), the oblique angle is such that the S polarization of the incident beam refracts through the glass plate, the P polarization reflects from the object;

means for causing the reflected S and P polarization beams to interfere (12);

a measurement photodetector (9);

means for measuring the distance between the surfaces (11).

Grego does not show the interferometer being applied to measure flying height. De Groot shows an interferometer measuring the flying height where the distance between a glass plate and an opaque object is determined. At the time of the invention, one of ordinary skill in the art would have been motivated to modify Grego to measure the distance between a glass plate and an opaque object because de Groot shows that obtaining the distance (flying height) is desired in his apparatus. One of ordinary skill in
